

Authentication

To access the FR24 API, you need to authenticate your requests using HTTP Bearer tokens. Authentication ensures that only authorized users can interact with the API, providing security and accountability for all API usage.

Obtaining your API token

Your API tokens can be found and managed in the [Key management](#) section of your account dashboard. Each token is a unique string that represents your credentials when making API requests. Please note that to generate an API key, you must have an active subscription. For more details on subscription plans, visit [Subscription & credits](#) page.

Authenticating requests

All API requests must include an **Authorization** header containing the word **Bearer** followed by a space and your API token.

Header format

```
Authorization: Bearer <your_api_token>
```

Replace `<your_api_token>` with the actual token obtained from the Key management section.

Example Usage

Here's an example of how to make an authenticated request to the FR24 API using `curl`:

```
curl --location  
'https://fr24api.flightradar24.com/api/static/airlines/afl/light' \  
--header 'Accept: application/json' \  

```

Documentation

Authentication

~~scope: <version>: v indicates the API version you are targeting.~~

Authorization: Bearer <your_api_token> provides your API token for authentication.

Important note: Treat your API token like a password. Do not expose it in client-side code, public repositories, or share it with unauthorized individuals.

Key management

Manage your API tokens through the Key management section in your account dashboard. This allows you to:

- **View active tokens:** Monitor all tokens currently in use.
- **Create new tokens:** Generate new tokens for different applications or environments.
- **Revoke tokens:** Disable tokens that are no longer needed or may have been compromised. By properly managing your API tokens, you maintain control over who can access your API resources and ensure the security of your data.
