

Getting started

Introduction

Overview of the API

Welcome to the Flightradar24 API documentation. Our API grants you immediate access to real-time and historical flight data, along with comprehensive information about airports and airlines. Whether you are developing an aviation app, integrating flight data into your systems, or conducting research, our API provides robust and reliable data to meet your needs. Please refer to [Flightradar24 Terms & conditions](#) for detailed information and prohibited use cases.

Key features and benefits

- **Real-time flight data:** Access up-to-the-minute flight positions and movements.
- **Historical data:** Retrieve historical flight data for up to May 2016.
- **Comprehensive airport and airline information:** Get detailed data on airports and airlines worldwide.
- **Flexible plans and sandbox environment:** Choose a subscription plan that fits your needs and test in a sandbox environment without using your credits.
- **Automated top-up:** Streamline your setup with our automated top-up system.

Step 1: Create an Account or Log In

Logging in

- If you already have a Flightradar24 account, log in using your existing credentials.
- Navigate to the Flightradar24 API Portal and click "Log in"
- Enter your email and password, then click "Log in with email" or use Single Sign-On platform (Google, Apple, Facebook)

Create account

Navigating to the sign-up page

Visit the [Flightradar24 API portal](#) and click "Create account".

Documentation

Getting started

You will receive a verification email. Click on the verification link in the email to confirm your account.

Step 2: Test endpoints on sandbox

To get started with testing, Flightradar24 API offers a Sandbox environment where you can try out API requests without using your subscription credits. Simply follow the steps to make calls to our endpoints and review the results. This is especially useful for experimentation and integration development. For more details on how to use the sandbox, check our [Sandbox documentation](#).

Step 3: Purchasing a subscription plan

FR24 API subscription plans

We offer three subscription plans: Explorer, Essential, and Advanced. Each plan provides a different number of monthly credits, rate limiting and access to various endpoints.

- **Explorer:** Best for testing or private individuals building their hobby projects.
- **Essential:** Ideal for regular use and small businesses.
- **Advanced:** For scaling up and high-volume usage.

Please note that the FR24 API subscription is separate from Flightradar24.com subscription plans.

Selecting and purchasing a plan

1. Navigate to [Subscription & credits](#) page.
2. Choose the plan that best suits your needs.
3. Click "Start subscription" and enter your payment details.
4. After payment, you will receive a confirmation email. Your subscription is now active.

Managing your subscription

- **Upgrading Your Plan:** Visit [Subscription & credits](#) to change your subscription plan.
- **Canceling the Subscription:** You can cancel at any time through the account settings.

Documentation

Getting started

Step 4: Generating an API token

1. Log in to the portal and go to the [Key management](#) page.
2. Click "Create token" and give your token a descriptive name.
3. Copy the token and store it securely. The token will not be visible again. Do not share it publicly.

Step 5: Making your first API call

Setting up your environment

Ensure you have tools like Postman, cURL, or the official [SDKs](#). For API endpoint details please refer to the [FR24 API Endpoints summary](#). Refer to the [Storage rules](#) documentation to understand maximum storage periods.

Making Your First API Call in Python

Our Python SDK can help you to ease the way of the FR24 API usage. Simply install the library, and run the code sample.

Prerequisites:

- Python installed on your machine.
- `requests` library installed (`pip install requests`).

Code sample:

```
pip install fr24sdk
```

```
from fr24sdk.client import Client

with Client(api_token="your_api_token") as client:
    result =
client.live.flight_positions.get_light(bounds="50.682,46.218,14.422,22.243"
) # N, S, W, E
print(result)
```

Documentation

Getting started

- **HTTP Method: GET**
 - **Request Headers:** Include your API token in the header as `Authorization: Bearer <your_api_token>` and API version as `API Version: v1`
 - **Request parameters:** The API uses path and query parameters to pass data. Ensure that the required parameters are included in the URL or as query parameters. Check our [endpoints article](#) for details on how to construct the requests.

Handling the API response

Understanding response codes: Our API uses standard HTTP response codes:

- **200 OK** for a successful request.
- **400 Bad Request** for invalid requests.
- **401 Unauthorized** when authentication fails. Check your API token.
- **402 Insufficient credits** when the request is understood, but access is denied, because of credit balance. Check your subscription or top-up the account.
- **404 Not Found** when the requested resource does not exist.
- **500 Internal Server Error** for server-side errors.
- **Parsing Response Data:** Handle the JSON response appropriately in your application. Below is an example of how to make and handle a request in Python

Step 6: Exploring further

For more in-depth insights, check out our [Examples and use cases](#) article, where we explore real-world applications and provide detailed examples or check [Endpoints document](#) to help you get started.
