

Python SDK (fr24sdk) – Quick Start

Overview

The official Flightradar24 Python SDK (**fr24sdk**) wraps the FR24 API v1 with a typed, convenient client and resource helpers (e.g., `client.airports.get_full("WAW")`, `client.live.get_flights(...)`). It handles auth, error types, and response parsing for you.

- Github: github.com/Flightradar24/fr24api-sdk-python
- Pypi: pypi.org/project/fr24sdk

Installation

```
# using pip
pip install fr24sdk

# or using uv
uv pip install fr24sdk
```

These commands install the latest release from PyPI.

Authentication

Set your API token once as an environment variable, or pass it to the client:

```
# macOS/Linux
export FR24_API_TOKEN="your_actual_token_here"

# Windows (PowerShell)
$Env:FR24_API_TOKEN="your_actual_token_here"
```

```
from fr24sdk.client import Client

# Option A: token from FR24_API_TOKEN env var
client = Client()
```

Documentation

Python SDK (fr24sdk) – Quick Start

Quick start examples

Airport details

```
from fr24sdk.client import Client

with Client() as client:
    waw = client.airports.get_full("WAW")
    print(waw.name, waw.icao, waw.city, waw.country, waw.lat, waw.lon)
```

`client.airports.get_full(...)` returns a typed object with airport attributes.

Live flight positions in a bounding box

```
from fr24sdk.client import Client

bounds = "50.682,46.218,14.422,22.243" # N, S, W, E
with Client() as client:
    flights = client.live.flight_positions.get_light(bounds=bounds)
    print(f"Flights returned: {len(flights.data)}")
```

The SDK exposes `client.live.flight_positions.get_light(...)` to query live positions; pass the same bounds you'd use in the HTTP API.

Flight summary & tracks

```
from fr24sdk.client import Client

with Client() as client:
    summary = client.flight_summary.get_light(flight_ids=["391fdd79"]) #
example flight_id
    tracks = client.flight_tracks.get(flight_id=["391fdd79"])
    print(summary, tracks)
```

See the [SDK Basic Examples](#) document to see more examples.
